CREATE CHANGE

Non-metropolitan Settlement and Integration Outcomes of Humanitarian migrants in Australia

Cho Yat Wong, Francisco Perales, Aude Bernard

The University of Queensland

2023 PANZ Conference

Background

Resettlement in Australia

- Strict onshore asylum-seeking policies, but common destination (Fozdar and Hartley, 2013).
- ~115,000 humanitarian migrants resettled in Australia over the past decade (Australian Red Cross, 2022).

Policy shift (Department of Home Affairs, 2020; Forrest et al., 2012; Hugo, 2011)

- 45% humanitarian migrants settled in non-metro areas in 2019 compared to 10% in the 2000s and early 2010s 50% target

International evidence is mixed

- Poorer employment, education, housing, health outcomes, and higher risk of discrimination in the UK, Sweden and Canada (Boswell, 2003; Aslund, 2005; Phillips, 2006; Stewart and Shaffer, 2015; Rose, 2019).
- Better school enrolment and probability of finding first job in Denmark and Sweden (Damm and Rosholm, 2010; Hernes, Arendt, Joona, and Tronstad, 2019).

Non-Metropolitan settlement outcomes of humanitarian migrants in Australia

Labour market outcomes (Curry et al., 2018; Hugo, 2011; Wilding and Nuun, 2018)

- More low-skilled jobs available; but a mismatch of skills, aspirations and occupational outcomes, and lower income.

Education (Joyce and Liamputtong, 2017)

- There is limited access to higher and quality education and not enough teacher, especially for trained teacher who is familiar humanitarian migrants

Social outcomes (Curry et al., 2018; Major et al., 2013; Wilding and Nuun, 2018)

- The communities were regarded as welcoming and supportive, but there are also reports of discrimination and racism
- Ethnic communities are less established and small in non-metropolitan areas

However, existing research is mainly qualitative.

Conceptualising integration

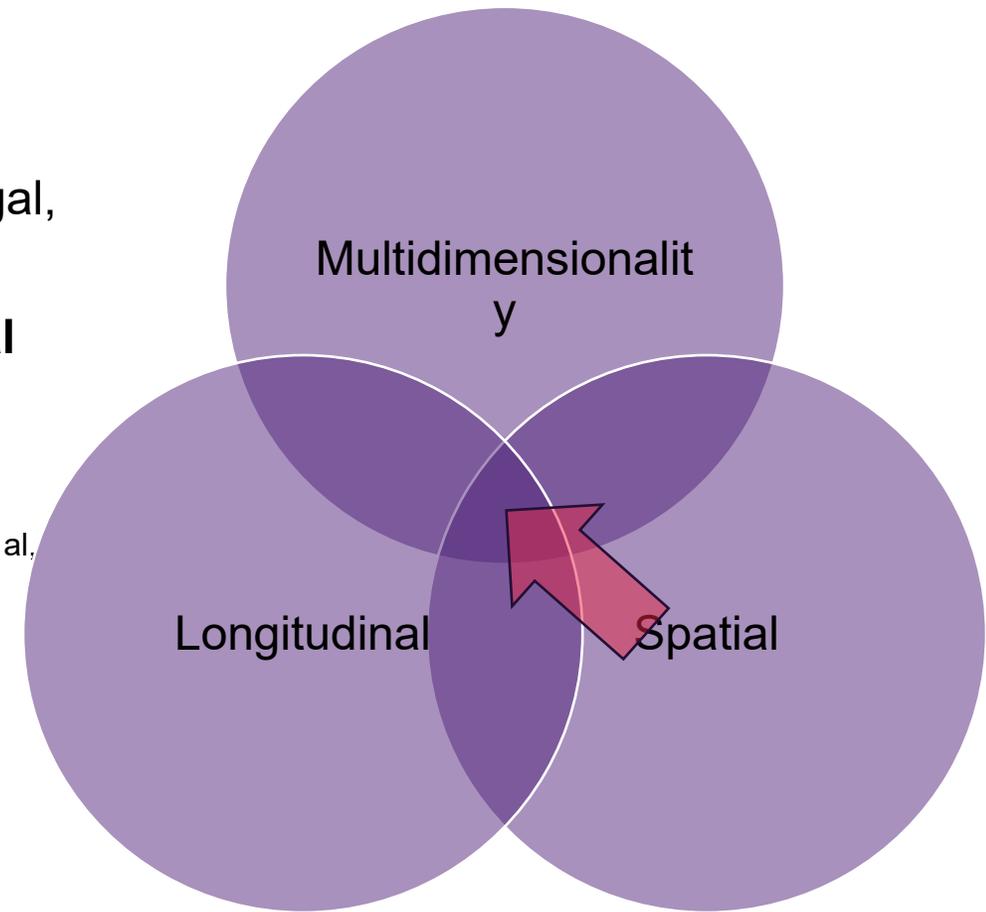

Resettlement is not the end of the journey for people seeking refuge

- Integration is a complex and gradual process, comprised of legal, economic, social and cultural dimensions (UNHCR, 2021)

Integration as a **multidimensional, longitudinal and spatial process**

- Existing research is mainly cross-sectional and neglected the heterogeneity of the longitudinal nature of integration. (Pritchard et al., 2019)

Especially for the spatial aspect of integration.

Toward an unified approach to integration

Multinational process (Ager and Strang, 2008)

- Markers and means (Employment; Education; Housing; Health)
- Social connections (Social bridges; Social bonds; Social links)
- Facilitators (Language and cultural knowledges; Safety and stability)
- Foundation (Rights and citizenship)

Non-linear and enduring process (Lichtenstein and Puma, 2019)

- Different domains of integration do not improve in a constant pace and same pace.
- Some of the integration outcomes of humanitarian migrants take years to catch up with other migrants

Location of settlement matters (Hugo, 2008; Joyce and Liamputtong, 2017; Major et al., 2013)

- Access to key services and resources, and social network
- Subsequent migration trajectories, labour market outcomes and ethnic concentration/segregation
- Neighbourhood effects

Research Question

1. Is there any association between settlement location (metro vs non-metro) and integration outcomes of humanitarian migrants?
2. Do the associations shift over time?

Building a New Life in Australia (BNLA)

Building a New Life in Australia (BNLA)

- Longitudinal study HMs who were granted PR in 2013
- 5 waves of annual panel data from 2013 to 2018
- Enables us to study multiple integration over time across metropolitan and non-metropolitan
- Sample (9,401 observations and 2,314 individuals)
 - Humanitarian migrants who were 18-65 at the time of interview

Measures

Independent variables

- Metropolitan vs non-metropolitan (based on the ASGS remoteness classification)
- Wave (Duration of stay)

Outcomes of interests

- Objective outcomes
 - In paid work, weekly income, NEET, Having stable housing (long-term contract and house ownership vs other arrangement)
- Subjective
 - Self-reported physical health, probable serious mental health illness (K6 scores), English proficiency, life satisfaction, experience of discrimination, sense of belonging

Analytic Methods

Randoms effects regression models

$$y_{it} = \beta_0 + \beta_1 region_{it} + \beta_2 wave_{it} + a_i + \epsilon_{it} \quad (1)$$

$$y_{it} = \beta_0 + \beta_1 region_{it} + \beta_2 wave_{it} + \beta_3 x_{it} + a_i + \epsilon_{it} \quad (2)$$

$$y_{it} = \beta_0 + \beta_1 region_{it} + \beta_2 wave_{it} + \beta_3 (wave * region) + \beta_4 x_{it} + a_i + \epsilon_{it} \quad (3)$$

region: 0=metropolitan, 1=non-metropolitan

i: individuals

t: wave

x: control variables (primary/secondary applicants, country of origin, onshore/offshore applicants, sex, age, educational attainment, marital status, number of children, employment before arrival)

Findings (regression results)

$$y_{it} = \beta_0 + \beta_1 \text{region}_{it} + \beta_2 \text{wave}_{it} + \beta_3 x_{it} + a_i + \epsilon_{it} \quad (2)$$

Findings (interaction effects)

Summary of Findings

- Integration outcomes are mixed.
- Non-metropolitan settlement is associated with better employment outcome, having stable housing and lower risks of being NEET, but higher risks of being discriminated against.
- The improvements in income, English proficiency are slower in non-metropolitan areas, but the probability of having stable housing is greater over time.
- Despite the disparities observed, there is no significant difference in life satisfaction and sense of belonging of humanitarian migrants.
- There is no significant difference in the physical and mental health outcomes of humanitarian migrants between non-metropolitan and metropolitan settlement.

Concluding remark

Limitations

- The proportion of humanitarian migrants in non-metropolitan area is small.
- Coarse spatial data.
- Only one arrival cohort, policy change not considered in other years.

Contributions

- Qualitatively study some objective integration outcomes jointly with subjective outcomes which is not covered by administrative data.
- This research spatially, longitudinally and multidimensionally studied the relationships between settlement location and the integration outcomes of humanitarian migrants in Australia.

Future research

- Administrative data (Multi-Agency Data Integration Project)
 - Finer spatial scales linked to visa status and labour market outcomes
 - Longer time-series (2006- 2021)
 - Over 200,000 humanitarian migrants in MADIP.

MADIP sample

Year	Metropolitan	Proportion	Non-metropolitan	Proportion	Total	Proportion
